Autumn Semester, 2025/26

Outline

- Defining a relation via Cartesian product
- Relation Terminology

Outline

Cartesian product

Recall that the Cartesian product of two sets, A and B, is the set of all ordered pairs of all elements where the first element is from set A and the second element is from B.

Definition 1 (Cartesian product)

The Cartesian product of two sets A and B, denoted by $A \times B$ is

$$A \times B = \{(a, b) \mid a \in A, b \in B\}$$

- The order within the pair matters, so $(a, b) \neq (b, a)$.
- But, since $A \times B$ is a set, the order between the pairs is not important.

$$\{(a, b), (c, d)\} = \{(c, d), (a, b)\}$$

- The set $A \times B$ has $|A||B|$ elements.

Cartesian product

Recall that the Cartesian product of two sets, A and B, is the set of all ordered pairs of all elements where the first element is from set A and the second element is from B.

Definition 1 (Cartesian product)

The Cartesian product of two sets A and B, denoted by $A \times B$ is

$$A \times B = \{(a, b) \mid a \in A, b \in B\}$$

- The order within the pair matters, so $(a, b) \neq (b, a)$.
- But, since $A \times B$ is a set, the order between the pairs is not important.

$$\{(a, b), (c, d)\} = \{(c, d), (a, b)\}$$

- The set $A \times B$ has $|A||B|$ elements.

Example

Example 2

The Cartesian product of $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

Or in Python*...

```
A = {0,1,2,3}
B = {0,1,4}

C = {(a,b) for a in A for b in B}

print (C)
```

```
{(0, 1), (0, 0), (3, 0), (3, 1), (1, 4), (2, 1), (2, 0), (2, 4), (0, 4), (1, 0), (3, 4), (1, 1)}
```

*From now on I will break with the upper/lower case programming naming convention that you are probably using in Processing/Java and follow conventions in Mathematics.

Example

Example 2

The Cartesian product of $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

$$\{(0,0),(0,1),(0,4),(1,0),(1,1),(1,4),(2,1),(2,1),(2,4),(3,0),(3,1),(3,4)\}$$

Or in Python*...

```
A = {0,1,2,3}
B = {0,1,4}

C = {(a,b) for a in A for b in B}

print (C)
```

```
{(0, 1), (0, 0), (3, 0), (3, 1), (1, 4), (2, 1), (2, 0), (2, 4), (0, 4), (1, 0), (3, 4), (1, 1)}
```

*From now on I will break with the upper/lower case programming naming convention that you are probably using in Processing/Java and follow conventions in Mathematics.

Example

Example 2

The Cartesian product of $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

$$\{(0, 0), (0, 1), (0, 4), (1, 0), (1, 1), (1, 4), (2, 1), (2, 1), (2, 4), (3, 0), (3, 1), (3, 4)\}$$

Or in Python*...

3
```
A = {0,1,2,3}
B = {0,1,4}

C = {(a,b) for a in A for b in B}

print (C)
```

```
{(0, 1), (0, 0), (3, 0), (3, 1), (1, 4), (2, 1), (2, 0), (2, 4), (0, 4), (1, 0), (3, 4), (1, 1)}
```

*From now on I will break with the upper/lower case programming naming convention that you are probably using in Processing/Java and follow conventions in Mathematics.

Relation I

The formal definition of a relation is based on the Cartesian product between two sets, later we will see more initiative but less general definitions.

Definition 3 (Relation)

Given two sets A and B. **Any** subset of the Cartesian product between A and B is called a relation.

Example 4

The Cartesian product of the sets $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

$$\{(0,0),(0,1),(0,4),(1,0),(1,1),(1,4),(2,0),(2,1),(2,4),(3,0),(3,1),(3,4)\}$$

So possible relations between A and B include

- $R = \{(0,0),(1,1),(2,4)\}$ (relation is based on $x \mapsto x^2, x < 3$)
- $R = \{(0,0),(1,1),(2,0),(3,1)\}$ (relation is based on $x \mapsto x \mod 2$)
- $R = \{(0,0),(1,0),(2,1),(3,1)\}$ (relation is based on $x \mapsto \text{isPrime}(x)$)
- $R = \{(0,0),(1,4)\}$ (relation is ... unknown?)
- $R = \{\}$ (remember, an empty set is a set)

Relation I

The formal definition of a relation is based on the Cartesian product between two sets, later we will see more initiative but less general definitions.

Definition 3 (Relation)

Given two sets A and B. **Any** subset of the Cartesian product between A and B is called a relation.

Example 4

The Cartesian product of the sets $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

$$\{(0,0),(0,1),(0,4),(1,0),(1,1),(1,4),(2,0),(2,1),(2,4),(3,0),(3,1),(3,4)\}$$

So possible relations between A and B include

- $R = \{(0,0),(1,1),(2,4)\}$ (relation is based on $x \mapsto x^2, x < 3$)
- $R = \{(0,0),(1,1),(2,0),(3,1)\}$ (relation is based on $x \mapsto x \mod 2$)
- $R = \{(0,0),(1,0),(2,1),(3,1)\}$ (relation is based on $x \mapsto$ isPrime(x))
- $R = \{(0,0),(1,4)\}$ (relation is ... unknown?)
- $R = \{\}$ (remember, an empty set is a set)

Relation I

The formal definition of a relation is based on the Cartesian product between two sets, later we will see more initiative but less general definitions.

Definition 3 (Relation)

Given two sets A and B. **Any** subset of the Cartesian product between A and B is called a relation.

Example 4

The Cartesian product of the sets $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

$$\{(0,0),(0,1),(0,4),(1,0),(1,1),(1,4),(2,0),(2,1),(2,4),(3,0),(3,1),(3,4)\}$$

So possible relations between A and B include

- $R = \{(0,0),(1,1),(2,4)\}$ (relation is based on $x \mapsto x^2, x < 3$)
- $R = \{(0,0),(1,1),(2,0),(3,1)\}$ (relation is based on $x \mapsto x \mod 2$)
- $R = \{(0,0),(1,0),(2,1),(3,1)\}$ (relation is based on $x \mapsto$ isPrime(x))
- $R = \{(0,0),(1,4)\}$ (relation is ... unknown?)
- $R = \{\}$ (remember, an empty set is a set)

Relation I

The formal definition of a relation is based on the Cartesian product between two sets, later we will see more initiative but less general definitions.

Definition 3 (Relation)

Given two sets A and B. **Any** subset of the Cartesian product between A and B is called a relation.

Example 4

The Cartesian product of the sets $A = \{0, 1, 2, 3\}$ and $B = \{0, 1, 4\}$ is

$$\{(0,0),(0,1),(0,4),(1,0),(1,1),(1,4),(2,0),(2,1),(2,4),(3,0),(3,1),(3,4)\}$$

So possible relations between A and B include

- $R = \{(0,0),(1,1),(2,4)\}$ (relation is based on $x \mapsto x^2, x < 3$)
- $R = \{(0,0),(1,1),(2,0),(3,1)\}$ (relation is based on $x \mapsto x \mod 2$)
- $R = \{(0,0),(1,0),(2,1),(3,1)\}$ (relation is based on $x \mapsto$ isPrime(x))
- $R = \{(0,0),(1,4)\}$ (relation is ... unknown?)
- $R = \{\}$ (remember, an empty set is a set)

Relation I

  - R is an element of the power set of the Cartesian product of A and B.

    $$R \in \mathcal{P}(A \times B)$$

Example

Example 5

Let $A = \{2, 3, 5, 6\}$ and define a relation R from A to A by $(a, b) \in R$ if and only if a divides evenly into b.

The relation R is defined by

$$R = \{(a, b) \mid a \in A, b \in A, a \text{ divides evenly into } b\}$$

The set of pairs that qualify for membership of R is

$$R = \{(2, 2), (3, 3), (5, 5), (6, 6), (2, 6), (3, 6)\}$$

Definition 6 (Relation on a Set)

A relation from set A to A is called a relation on A.

Notation Warning —- Divisibility

When explaining relations we will often use (as in the previous example) the idea of “divides”. Lets make sure we all agree on what this means …

Definition 7 (Divides)

Let $a, b \in \mathbb{Z}$. We say that a divides b, denoted $a \mid b$, if and only if there exists an integer k such that $ak = b$.

- Be careful in writing about the relation “divides.” The vertical line symbol use for this relation, if written carelessly, can look like division. While $a \mid b$ is either **True** or **False**, a/b is a number[†].
- Even worse. We, mathematicians, use the same symbol “$|$” for "such that" in set builder notation and for “divides”.
  - Usually this is not a problem as the intended meaning for “$|$” will be clear from the context.
  - Use alternative symbols: “$|$” is replaced by “:” in set builder notation.

[†] Also the direction is different. “$a \mid b$” means “a divides (evenly) into b”, while “a/b” means “the value of a divided by b”.

Notation Warning —- Divisibility

In python `R = { (a,b) for a in A for b in B if a<b }`

The domain is the subset of the source that is used in the relation, i.e., each element has at least one arrow out

The source is the set the relation is going from, i.e., first element in pair

The target is the set the relation is going to, i.e., second element in pair

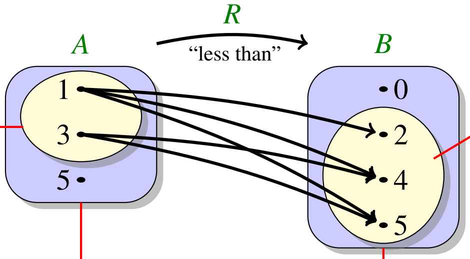
Relation Terminology I

Consider the relation "is less than" from set $A = \{1, 3, 5\}$ to set $B = \{0, 2, 4, 5\}$. We have

$$R = \{(a, b) \mid a \in A, b \in B, a < b\} = \{(1, 2), (1, 4), (1, 5), (3, 4), (3, 5)\}$$

In python `R = { (a,b) for a in A for b in B if a<b }`

The domain is the subset of the source that is used in the relation, i.e., each element has at least one arrow out



The image is the subset of the target that is used in the relation, i.e., each element has at least one arrow in

The source is the set the relation is going from, i.e., first element in pair

The target is the set the relation is going to, i.e., second element in pair

Relation Terminology II

Given relation R from set S to set T we have:

- The source, S, is the set that the relation is going from.
- The target, T, is the set that the relation is going to.
- The domain of R, denoted by $\mathrm{Dom}(R)$, is the subset of the source for which there is at least one arrow leaving each element.

$$\mathrm{Dom}(R) = \{s \mid s \in S, \underbrace{\exists t \in T((s,t) \in R)}_{\text{exists at least one arrow leaving each element}}\} \subseteq S$$

- The image of R, denoted by $\mathrm{Im}(R)$, is the subset of the target for which there is at least one arrow entering each element.

$$\mathrm{Im}(R) = \{t \mid t \in T, \underbrace{\exists s \in S((s,t) \in R)}_{\text{exists at least one arrow entering each element}}\} \subseteq T$$

Relation Terminology — Into vs. Onto III

From our definitions, we have that the image of a relation is a subset of its target, i.e.,

$$\mathrm{Im}(R) \subseteq T$$

This gives us two possibilities …

or

Relation Terminology — Into vs. Onto III

From our definitions, we have that the image of a relation is a subset of its target, i.e.,

$$\mathrm{Im}(R) \subseteq T$$

This gives us two possibilities …

$\mathrm{Im}(R) \subset T$

or

$\mathrm{Im}(R) = T$

Relation Terminology — Into vs. Onto III

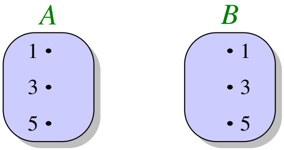
From our definitions, we have that the image of a relation is a subset of its target, i.e.,

$$\mathrm{Im}(R) \subseteq T$$

This gives us two possibilities . . .

$$\mathrm{Im}(R) \subset T$$

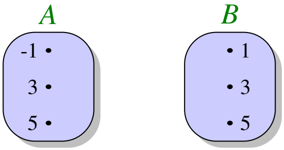
Example, consider relation "is less than" from set $A = \{1, 3, 5\}$ to set $B = \{1, 3, 5\}$ is



or

$$\mathrm{Im}(R) = T$$

Example, consider relation "is less than" from set $A = \{-1, 3, 5\}$ to set $B = \{1, 3, 5\}$ is



Relation Terminology — Into vs. Onto III

Relation Terminology — Into vs. Onto III

From our definitions, we have that the image of a relation is a subset of its target, i.e.,

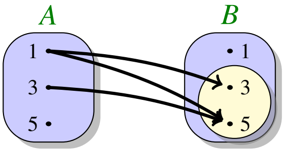
$$\text{Im}(R) \subseteq T$$

This gives us two possibilities …

$$\text{Im}(R) \subset T$$

Example, consider relation "is less than" from set $A = \{1, 3, 5\}$ ~~to~~ into set $B = \{1, 3, 5\}$ is

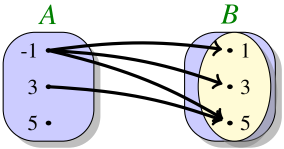


A relation, R, in which the image is a proper subset of the target is said to be an into relation.

or

$$\text{Im}(R) = T$$

Example, consider relation "is less than" from set $A = \{-1, 3, 5\}$ ~~to~~ onto set $B = \{1, 3, 5\}$ is



A relation, R, in which the image is equal to the target is said to be an onto relation.

Relation Terminology — Injective (one-to-one) III

Definition 8 (Injective)

A relation is said to be injective (or one-to-one) if there is at most one arrow into every element in the target set.

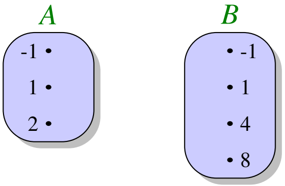
or

Relation Terminology — Injective (one-to-one) III

Definition 8 (Injective)

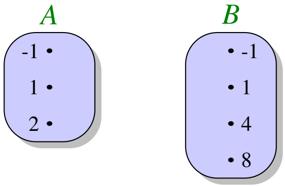
A relation is said to be injective (or one-to-one) if there is at most one arrow into every element in the target set.

Consider the relation “is square root of” from set $A = \{-1, 1, 2\}$ to set $B = \{-1, 1, 4, 8\}$.



or

Consider the relation “‘‘is cube root of” from set $A = \{-1, 1, 2\}$ to set $B = \{-1, 1, 4, 8\}$.

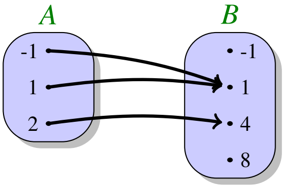


Relation Terminology — Injective (one-to-one) III

Definition 8 (Injective)

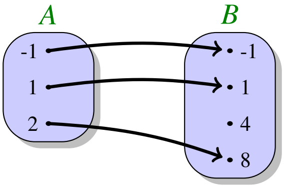
A relation is said to be injective (or one-to-one) if there is at most one arrow into every element in the target set.

Consider the relation "is square root of" from set $A = \{-1, 1, 2\}$ to set $B = \{-1, 1, 4, 8\}$.



or

Consider the relation ""is cube root of" from set $A = \{-1, 1, 2\}$ to set $B = \{-1, 1, 4, 8\}$.

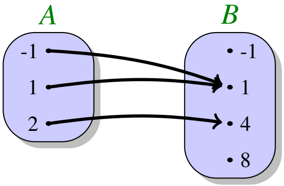


Relation Terminology — Injective (one-to-one) III

Definition 8 (Injective)

A relation is said to be injective (or one-to-one) if there is at most one arrow into every element in the target set.

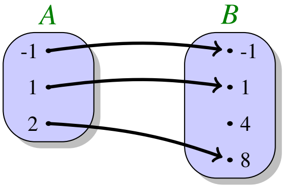
Consider the relation “is square root of” from set $A = \{-1, 1, 2\}$ to set $B = \{-1, 1, 4, 8\}$.



Not injective, since there exists at least one element in the target, (1), which has more than one incoming arrows.

or

Consider the relation ““is cube root of” from set $A = \{-1, 1, 2\}$ to set $B = \{-1, 1, 4, 8\}$.



Is injective, since there is at most one arrow into each element in the target.

Review Exercises 1 (Relation Definition)

Question 1:
Consider the sets $A = \{0, 1, \ldots, 6\}$ and $B = \{0, 1, \ldots, 12\}$. Draw each of the following relations, and specify the domain and image of R from A to B and whether it is into or onto, and injective or not.

a) $(a, b) \in R$ iff a divides b. $a \mid b$
b) $(a, b) \in R$ iff $a > b$
c) $(a, b) \in R$ iff number of primes less than a is equal to number of primes less than b
d) $(a, b) \in R$ iff number of factors of a is equal to number of factors of b.
e) $(a, b) \in R$ iff number of letters in writing a in English is equal number of letters in writing b in English.

Question 2:
Let R be the relation from $\mathbb{N}$ to $\mathbb{N}$ where $(a, b) \in R$ iff $b = a + 2$. Is R onto?
Question 3:
Let R be the relation from $\mathbb{Z}$ to $\mathbb{Z}$ where $(a, b) \in R$ iff $b = a + 2$. Is R onto?
Question 4:
Let R be the relation from $\mathbb{N}$ to $\mathbb{N}$ where $(a, b) \in R$ iff $b = a^2$. Is R one-to-one?
Question 5:
Let R be the relation from $\mathbb{Z}$ to $\mathbb{Z}$ where $(a, b) \in R$ iff $b = a^2$. Is R one-to-one?
